

Concerning BPL. One of the positive features of Amateur Radio is education to young potential engineers through the building and operation of receivers and transmitters; QRP operation offers this feature to many and seems to be increasing in popularity. From what I have been reading about BPL, The QRP operators would suffer more than the main body of Amateur Radio and possibly be eliminated in many locations. My belief is that this would be a very poor trade in the long run because it would trade an important educational benefit for NET access to a few people that already could use other systems. (I use a phone line for \$10 per month)My viewpoint is that BPL should either not be allowed or at best be coupled with very good filters on all Ham and commercial bands. These filters should be instigated by the FCC from the start. Thanks, Wilbur Cottle WY5K
